

# UNIFIED THREAT MANAGEMENT

## Cost Effective Features for SMB's SCIS SECURITY

### FASTER

Unified Threat Management (UTM's) typically have more durable and faster hardware and optimized software to **accelerate traffic** with quality of service as well as advanced traffic inspection capabilities.

### CONTENT INSPECTION

Traditional firewall and router devices don't actually inspect the content. They examine connections. UTM's inspect content and helps block attacks such as **malware and attacker exploits**.

### WEB FILTER

UTM's can enable URL or DNS filtering. **Improve productivity** by blocking websites not-relevant to your business operations. White label your own personalized message to users.

### HIGH AVAILIABILITY

UTM's can be load balanced or synced together to provide continuous traffic **without network interruption** in case of a hardware or power failure

### MSSP READY

UTM's also perform detailed logging which make them ready for Managed Security Service Providers to enable **SOC** and other **regulatory** requirements.
